

PN 16 Volute Centrifugal Pumps (depending on materials up to PN 25) according to EN 22858/ISO 2858 and EN ISO 5199

ALLCHEM®

CNH-B Series

Utilization

Used to pump non-aggressive or aggressive liquids, cold or hot liquids, clean liquids, liquids containing solid particles, or viscous liquids. Used in the chemical or petrochemical industries, in power engineering, in process technology, environmental protection technology, wastewater engineering, marine engineering, offshore, and surface engineering.

Design and construction

Horizontal, single-stage, single-flow volute-casing centrifugal pump according to DIN EN 22858/ISO 2858. The pump also complies with the technical requirements of EN ISO 5199.

This pump series is constructed as a modular system in order to enable use of as many uniform structural components as possible. The pump reflects a process design type. The shaft bearing is provided in a bearing bracket.

Pump casing

The pump casing consists of a volute casing and casing cover. Some sizes have an additional intermediate ring.

With the exception of materials version W22, the casing parts can also be delivered with a heated jacket (welded into place).

Volute casing

Volute casing with cast feet. Depending on the temperature of the liquid, some pump sizes are available with centerline mounted feet arrangement.

The volute casings on some sizes are provided with a double volute in order to balance out radial forces.

Casing cover

Thanks to the modular system, the same casing cover is used for all of the pump sizes that are matched to a particular bearing bracket.

In order to better remove the mechanical seal's frictional heat, the seal chamber is conical in shape and wide open. The mechanical seal is directly integrated into the casing cover without an additional sealing cover.

Wear rings

If desired, the volute casing and casing cover can be delivered with optional exchangeable wear rings.

Impeller

Closed radial impeller with throttle gap on the front and rear sides. Axial thrust compensation provided by relief bores. Impellers available with exchangeable wear rings upon request. The impellers are balanced according to DIN ISO 1940 (Mechanical vibration - Balance quality requirements for rotors in a constant (rigid) state) balance quality G 6.3.

Shaft

The pump is equipped with a particularly torsion-proof shaft. The torsion-proofness and short distance between the pump-side bearing and shaft sealing achieves a truth of running that creates optimal conditions for shaft sealing. Deflection in the area of the shaft sealing is below the maximum permissible loads of 0.05 mm.

With the two-sided sealing of the shaft sleeve and a sealed impeller nut, the shaft is fully protected against contact with the liquid ("dry shaft").

A key transfers torque to the impeller.

Shaft sleeve

A shaft sleeve is provided as standard equipment.

Optionally, ceramic coating in the area of the shaft seal can protect the shaft sleeve from wear.

Bearing bracket

Thanks to the modular system, only four bearing bracket sizes are used for all pump sizes.

The pump's process design type enables disassembly of the bearing bracket, including impeller, casing cover, and shaft seal, without having to remove the volute casing from the pipe. Similarly, the motor must not be disassembled when using a spacer coupling.

Bearing

The shaft bearing exhibits oversized antifriction bearings that are designed for a nominal service life of at least 25,000 operational hours, even when used under the most difficult conditions.

If extended bearing service life is required, a reinforced bearing can be provided upon request.

Lubrication

The bearing is equipped with standard permanently lubricated groove ball bearings.

With the alternative oil-lubricated bearing, high-quality alloyed mineral oil according to DIN 51502-CL46 or ISO 3448-VG46 is recommended for lubrication purposes. Oil regulation is performed by a standard constant level oiler. Shaft sealing is provided by means of radial shaft seal rings. When liquid temperature is +200 °C or higher, the bearing bracket is equipped with an oil-cooling device.

Performance data ①②

Capacity	Q	up to	1200	m ³ /h
Delivery head	H	up to	147	m
Discharge pressure	p _d	up to	25	bar ③
Liquid temperature	t	-100 up to	+350	°C
Nominal width of discharge branch	DN _d	25 up to	250	mm
Power	P	up to	220	kW

- ① The performance data overview is based on drive speeds that occur when using three-phase motors in a 50-Hz power grid. Refer to the proposal and order confirmation for exact operation limits.
- ② The specified operation limits are maximum values that may have to be reduced in individual cases depending on technical variations. Refer to the respective order documentation for binding values.
- ③ Observe pressure/temperature limits specific to the material. Inlet pressure plus the maximum differential pressure generated by the impeller may not exceed the permissible working pressure.

Minimum capacity

Minimum capacity through the pump is required in order to protect it from overheating and elevated vibrational loads. Dimensional limit is calculated as follows for all sizes: Min. capacity: $Q_{min.} = 0.1 \times Q_{opt.}$

Viscosity

During hydraulic selection, viscosities are considered with the corresponding conversion factors provided by Hydraulic Institute.

Viscous liquids can be efficiently pumped up to the following limits (based on the nominal width of the discharge branch):

Nominal width of discharge branch	< DN 50	up to	300	mm ² /s
Nominal width of discharge branch	< DN 150	up to	500	mm ² /s
Nominal width of discharge branch	> DN 150	up to	800	mm ² /s

Branch position and flanges

Suction branch:	axial			
Discharge branch:	radial facing upward			
Flanges:	with materials			
	W20	W22	W23	W26 and W27
	DIN EN 1092-1/B1/PN 16	DIN EN 1092-2/B/PN 25	DIN EN 1092-1/B1/PN 25	DIN EN 1092-1/B1/PN 25

Other flange dimensions/designs are available as options.

Shaft sealing

The following mechanical seal designs according to DIN EN 12756 are available:

Design	Sizes on bearing bracket			
	45 und 45/1	60	70	75
Unbalanced single seal	KU 043	KU 053	KU 065	KU 070
Unbalanced single seal in tandem design	KU 043 + KU 043	KU 053 + KU 053	KU 065 + KU 065	KU 070 + KU 070
Balanced single seal	KB 043	KB 053	KB 065	KB 070
Balanced single seal in tandem design	KB 043 + KU 043	KB 053 + KU 053	KB 065 + KU 065	KB 070 + KU 070
Back-to-back, pump and atmosphere sides not balanced	UU 043	UU 053	UU 065	UU 070
Back-to-back, pump side not balanced, atmosphere side balanced	UB 043	UB 053	UB 065	UB 070
Back-to-back, pump and atmosphere sides balanced	BB 043	BB 053	BB 065	BB 070

Single mechanical seals can be equipped with a quench. The atmosphere-side is then sealed by a throttle bush or radial shaft seal ring.

Non-standardized seals (such as Cardridge designs) available upon request.

Pressure and temperature limits, based on casing materials.

The provided pressure and temperature limits are maximum values that may be decreased depending on the design variation.

The base version can be used within the range of -30 to +160 °C. Outside this range, design measures will be needed.

Heated casing parts

Max. permissible pressure in heating chamber:	p =	20 bar
Max. permissible temp. in heating chamber:		
with wet steam	T =	210 °C
with heat transfer oil	T =	300 °C

Quench, buffering, and flushing liquid

Single mechanical seals can be and multiple mechanical seals in tandem arrangement must be equipped with a pressureless quench system.

Buffering fluid is needed with multiple mechanical seals in back-to-back arrangement in order to prevent escape of the pumped liquid and to lubricate the atmosphere-side seals. The pressure of the buffering fluid must be greater than the pressure of the pumped liquid.

The required amount of buffering fluid is 0.1 to 0.2 m³/h. The buffering fluid pressure should be about 1 bar over the pressure on the shaft seal.

The required buffering fluid pressure on the shaft seal is calculated as follows:

$$p_w = \frac{0,7 \times H_0 \times \rho}{10} \pm p_z + 1$$

- p_w Buffering fluid pressure in [bar]
- H_0 Pump delivery head at Q = 0 in [m]
- ρ Density in [kg/dm³]
- p_z Suction/inlet pressure in [bar]

Outside flushing liquid is utilized in order to prevent penetration of solids into the shaft seal when pumping abrasive liquids and liquids that tend for crystallize. It must be suitable for mixing with the liquid. The required amount of flushing liquid is 0.2 to 0.3 m³/h. The flushing liquid pressure should be about 1 bar over the pressure on the shaft seal.

Explosion protection

The pump fulfills the requirements according to EU explosion-protection directive 94/9/EC (ATEX 100a) for devices in device class II, category 2 G. Classification into temperature classes according to EN 13463-1 depends on the temperature of the pumped liquid. Refer to proposal and order documentation for the maximum permissible temperature of the liquid for the respective temperature classes.

Note: When operating the pump in category 2, suitable measures must be provided to prevent impermissible warming of the pump surfaces during disturbance.

Drive

Standard with separately mounted standardized three-phase squirrel-cage motor on a shared base plate.

Other drive systems are possible.

Rated output of the drive machine must be specified according to DIN ISO 5199.

Shaft coupling and coupling guard

Drive torque is transferred through a flexible coupling to the pump shaft. At higher liquid temperatures a double cardan coupling must be used in order to balance out the heat expansion.

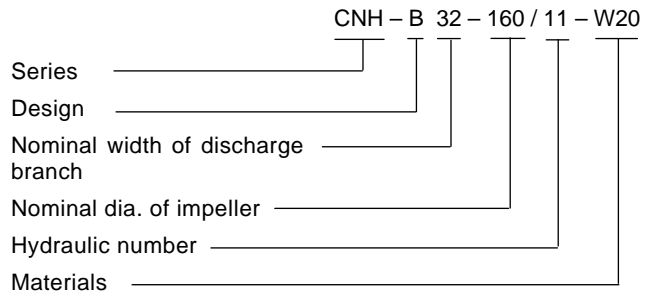

The shaft coupling can be delivered with or without a distance piece. The length of the distance piece is selected so that there is adequate axial tolerance to dismantle the insert unit.

A coupling guard with safety guarding according to DIN EN 294 is included whenever pump, base plate, and shaft coupling are delivered together.

Base plate

The pump unit is equipped with a U-plate as standard equipment. Optionally, a cast iron (steel with some sizes) base plate according to DIN 24259, EN 23661 or ISO 3661 can be provided.

Model code

ATTENTION: Sizes 65-160 and 80-160 also available in short design type with bearing bracket 45 as 65-160k and 80-160k (price benefit, only casing dimensions according to DIN EN 22858/ISO 2858).

1) Optional 2) When using common spare parts for several different pumps in one system, the quantity of each spare part is based on the total number of pumps.

Exchangeable
Chemical standard pumps according to DIN EN 22858/ISO 2858

Economical
Modular system makes spare parts stocks economical.

Modular
Convertible to hermetically sealed mag drive

Efficiency
thanks to very good hydraulics

Variable
flange standards

Versatile
materials, seal, heating etc.

Smooth running
with pretensioned bearing

Long service life
thanks to robust bearing design with a bearing life of at least 25,000 operational hours

Confident
with an uncompromising torsion-proof shaft system for incredibly reliable shaft sealing.

Safe in operation
through optimized environmental conditions for the mechanical seal. Constant removal of heat, solids, and gases from the gasket.

Easy to install
with process design

Maintenance-free
with lifetime grease-lubricated groove ball bearings or easy-to-maintain oil lube versions with constant level oiler

① not applicable to heated version

Auxiliary connections

Connections	Size	Description
B11	G 1/4	Shaft seal – sealing inlet
BO1	G 1/4	Shaft seal – sealing outlet
FD1	G 1/2	Volute casing – product draining
FV2	G 1/4	Seal chamber – product venting
GD1	G 1/4	Bearing bracket – lubrication draining
GF1	G 1/2	Bearing bracket (venting) – lubrication filling
GF2	G 1/4	Bearing bracket (constant level oiler) – lubrication filling
GV1	G 1/2	Bearing bracket – lubrication venting
HI1	G 3/8	Volute casing – heat steam inlet
HI2	G 3/8	Volute casing – heat liquid inlet
HI3	G 3/8	Casing cover – heat steam inlet
HI4	G 3/8	Casing cover – heat liquid inlet
HI5	G 1/4	Sealing cover – heat steam inlet
HI6	G 1/4	Sealing cover – heat liquid inlet
HO1	G 3/8	Volute casing – heat steam outlet
HO2	G 3/8	Volute casing – heat liquid outlet
HO3	G 3/8	Casing cover – heat steam outlet
HO4	G 3/8	Casing cover – heat liquid outlet
HO5	G 1/4	Sealing cover – heat steam outlet
HO6	G 1/4	Sealing cover – heat liquid outlet
II1	G 1/4	Seal chamber – injection/flushing liquid inlet
KI1	G 3/8	Seal chamber – cooling inlet
KI2	G 1/4	Bearing bracket – cooling inlet
KO1	G 3/8	Seal chamber – cooling outlet
KO2	G 1/4	Bearing bracket – cooling outlet
LO1	G 1/2	Pump collection trough – leak outlet
PM1	G 1/4	Suction branch - pressure gauging
PM2	G 1/4	Discharge branch - pressure gauging
QI1	G 1/4	Seal chamber – quench inlet
QO1	G 1/4	Seal chamber – quench outlet

Subject to technical alterations.

The mentioned performance data and additionally all standard references are to be considered as a product and performance abstract only. The particular operating limits can be taken from the quotation or order acknowledgement.
